

FINOVA AI

AI Operating System for Accounting & Financial Advisory

Product Requirements Document
Version 3.0 - Advisory Intelligence Edition

Automate the work. Elevate the judgment.

Built around direct feedback from accounting and consulting professionals:
automation is baseline value; insight, foresight and defensible recommendations
create higher-value consulting outcomes.

Status: Product / Engineering / Design Draft

1. Executive Summary

FINOVA AI is an Indonesia-first, AI-native operating system for accounting and financial advisory teams. The platform combines engagement execution, deterministic tax calculation, accounting-standard awareness, advanced analytics and advisory intelligence in one evidence-first workflow.

Core product promise: FINOVA transforms fragmented client data into review-ready work, defensible tax calculations, prioritized financial insights and actionable advisory recommendations - while keeping professional judgment and final sign-off with humans.

Version 3.0 is a strategic refinement. FINOVA is no longer framed only as a productivity tool that collects, summarizes and produces reports. It is designed to help accounting and consulting professionals move from data -> work -> analysis -> insight -> recommendation.

Layer	Primary Value
Execution	Automate repetitive document collection, extraction, mapping, workpaper preparation and review preparation.
Calculation	Run deterministic, versioned tax calculations and reconciliations.
Compliance	Ground material outputs in applicable standards, rules and traceable source references.
Intelligence	Explain what changed, why it may have changed, what it means and what should be investigated next.
Advisory	Generate evidence-backed hypotheses, scenarios and client-ready recommendations for human refinement.

2. Why V3.0 Exists

Direct practitioner feedback highlighted two gaps that materially improve the product thesis:

- Standards matter. Accountants will question whether generated outputs comply with applicable accounting and professional standards. FINOVA therefore requires a Standards & Compliance Layer, not only generic AI generation.
- Consulting value goes beyond reporting. Consultants are expected to explain rising costs, falling revenue, operational drivers, next steps and forward-looking implications. FINOVA therefore needs Advisory Intelligence, not only summaries or dashboards.
- Automation remains essential. Repetitive execution should still be accelerated, but that is the foundation - not the end-state value proposition.

V3.0 thesis: Automation creates efficiency. Evidence creates trust. Insight and foresight create consulting value.

3. Product Positioning & ICP

3.1 Positioning

FINOVA - AI Operating System for Accounting & Financial Advisory.

Alternative customer-facing line: From client data to compliant work, tax calculations and actionable financial insight.

3.2 Primary ICP

- Indonesian SME and mid-sized KAPs, approximately 5-50 staff.
- Accounting, tax and financial consulting boutiques handling recurring client engagements.
- Teams relying heavily on Excel, email, WhatsApp and shared drives.
- Firms that want to increase consultant capacity without proportional headcount growth.

3.3 Primary Personas

Persona	Pain	FINOVA Outcome
Junior / Associate	Collection, data entry, formatting, repetitive prep	Automated intake, mapping, calculation support and guided work.
Senior	Heavy preparation + first review	Evidence-linked workpapers, exceptions and faster clearance.
Manager	Multiple engagements and review bottlenecks	Prioritized risks, analytics and unresolved issue visibility.
Partner / Lead Consultant	Quality, judgment, client value	Standards traceability, advisory insight, foresight and sign-off.
Tax Consultant	Rules, calculations, deadlines, reconciliation	Versioned deterministic tax engine with explainable outputs.

4. Jobs-to-be-Done

Job	FINOVA Should Help User...
Collect	Get complete client evidence without chasing files across channels.
Prepare	Transform source data into structured, review-ready workpapers.
Calculate	Apply supported Indonesian tax rules consistently and reproducibly.
Validate	Detect mismatches, missing evidence, anomalies and unsupported cases.
Comply	Understand which standards/rules support a material conclusion or output.
Analyze	Understand financial performance, cost, revenue, margin, working capital and risk.
Diagnose	Identify likely drivers and separate evidence from hypotheses.
Advise	Turn validated analysis into recommended investigations and business actions.
Communicate	Create client-ready findings, memos and report drafts with traceable support.

5. Product Principles

- Evidence before magic. Material AI outputs must link back to source evidence.
- Human judgment stays final. FINOVA supports professionals; it does not replace professional responsibility.
- Deterministic where correctness is calculable. Tax arithmetic, tie-outs and financial formulas use code/rules, not LLM guessing.
- Standards-aware by design. Compliance references are first-class objects, not decorative citations.
- Insight must distinguish fact, inference and hypothesis.
- Engagement-centric UX. The engagement is the unit of work; modules are capabilities inside it.
- Action over decoration. Analytics should answer what needs attention and what to investigate next.
- Institutional learning. Approved mappings, templates and firm methodology improve future work where permissions allow.

6. Product Architecture

CLIENT DATA -> DOCUMENT INTELLIGENCE -> STRUCTURED DATA -> WORKPAPER + TAX + STANDARDS -> REVIEW/QC -> ANALYSIS -> ADVISORY INTELLIGENCE -> FINDINGS / RECOMMENDATIONS / REPORTS

Layer	Responsibilities
Client & Engagement	Client master, engagement scope, period, team, PBC, milestones.

Layer	Responsibilities
Document Intelligence	Upload, OCR, classification, extraction, completeness, duplicates, evidence references.
Structured Data	Normalized accounts, transactions, financial statements, tax attributes and metadata.
Workpaper Engine	Mapping, auto-population, tie-outs, variances, review preparation.
Tax Engine	Deterministic calculation/reconciliation for supported scenarios.
Standards Layer	Applicable PSAK/IFRS/SPAP/tax rule reference records and version/effective-date metadata.
Review & QC	Exceptions, comments, clearance, approvals, locking, audit trail.
Analytics	Financial, audit, tax and engagement signals.
Advisory Intelligence	Why / So What / What Next, scenarios, hypotheses, recommendations.
Output	Findings, advisory memo, report draft, client presentation inputs.

7. MVP Scope & Non-Goals

7.1 Included

Capability	MVP Depth
Client Portal & PBC	Secure upload, checklist, progress, reminders, OTP guest access.
Smart Document Hub	OCR/extraction, classification, search, validation, versioning, evidence.
AI Workpaper Engine	TB/GL/FS mapping, auto-population, tie-out, variance and anomaly checks.
Tax Calculation Engine	PPh 21, PPh 23, PPN and fiscal reconciliation for explicitly supported scenarios.
Standards Layer	Verified source corpus + applicability/effective-date metadata for supported outputs.
Review & QC	Preparer -> Senior -> Manager -> Partner flow.
Findings	Evidence-backed draft findings from validated issues.
Advanced Analytics	Financial health, audit risk, tax exposure and engagement health.
Advisory Intelligence	Driver analysis, implication, investigation recommendations and selected scenario analysis.
Basic Reporting	Client-ready memo/report drafts using approved engagement data.

7.2 Non-Goals

- No autonomous audit opinion, final accounting judgment or automatic professional sign-off.
- No direct DJP tax filing in MVP.
- No support for every Indonesian tax case or every accounting standard scenario.
- No standalone generic chatbot as the primary experience.
- No full ERP integration suite; spreadsheet import/export remains universal fallback.
- No template marketplace, blockchain, SEA localization, full on-premise enterprise suite or native client app in MVP.
- No unsupported causality claims in Advisory Intelligence.

8. Client Portal & Smart Document Hub

- Firm-branded PBC checklist and secure document upload.
- Mobile-friendly guest flow with OTP.
- Statuses: Required, Uploaded, Needs Replacement, Accepted, Missing.
- AI classification with confidence; human correction supported.
- OCR and table extraction for supported formats.

- Structured field extraction with evidence location.
- Duplicate/version detection.
- Document completeness and quality checks.
- Full-text + structured search.
- All downstream values retain source lineage.

9. AI Workpaper Engine

9.1 Hero Workflow

Trial Balance / GL / Financial Statements -> normalize -> map -> populate workpaper -> deterministic validation -> AI review signals -> human review.

9.2 Mapping Model

Component	Requirement
Inputs	Account code/name, historical approved mapping, firm template, engagement context.
Suggestion	Workpaper section/cell plus confidence and rationale.
Needs Review	Ambiguous mapping or conflicting evidence enters a review queue.
Override	Human can correct; original suggestion and final mapping are logged.
Reuse	Approved firm-specific mappings may inform future engagements within permissions.
Evidence	Every populated material value links to source TB/GL/FS evidence.

9.3 Automated Checks

- TB vs FS vs workpaper tie-out.
- Absolute and percentage variance thresholds.
- Missing required evidence / empty expected fields.
- Round-number, unusual timing/user, large one-off and configurable GL flags.
- Cross-period consistency and repeat issue detection.
- Materiality-aware prioritization where firm configuration provides thresholds.

10. Tax Calculation Engine

LLMs can explain tax results. They cannot be the arithmetic source of truth.

10.1 MVP Scope

- PPh 21: supported common employee scenarios and supported TER treatment.
- PPh 23: supported service/withholding scenarios.
- PPN: input/output reconciliation and selected exception logic.
- Fiscal reconciliation: mapped P&L; adjustments and permanent/temporary difference workflow.

10.2 Rule Model

Field	Requirement
Rule ID	Stable machine-readable identifier.
Source	Verified regulation / official reference.
Effective Date	Explicit start date and, when known, end/superseded date.
Applicability	Tax type, taxpayer/scenario constraints and exclusions.
Formula	Deterministic implementation with test cases.

Field	Requirement
Version	Historical reproducibility.
Explanation	Human-readable rationale after calculation.
Review	Unsupported or ambiguous case blocks automation and requests professional review.

11. Standards & Compliance Layer

The Standards Layer responds directly to practitioner concern that a generated report or workpaper must be defensible against applicable standards, not merely well-written.

11.1 Initial Sources

- PSAK and IFRS references relevant to supported financial reporting analysis.
- SPAP / audit methodology references where licensing/access permits and the firm has valid source rights.
- Verified Indonesian tax regulations for Tax Engine rules.
- Firm-uploaded SOP, methodology and approved templates.

11.2 Standards Object

Attribute	Purpose
Standard / Rule	Identifies governing source.
Version / Effective Date	Prevents outdated references from masquerading as current.
Relevant Requirement	Specific section or rule metadata supporting the output.
Applicability	Context in which the requirement is relevant.
Source Provenance	Official/verified source record.
Human Confirmation	Reviewer confirms applicability before final output where judgment is material.

FINOVA must not claim compliance with a standard solely because an LLM generated a citation. Citations require a verified source corpus and applicability checks.

12. Review, QC & Findings

State flow: Generated / Calculated -> Needs Review -> Edited or Confirmed -> Approved -> Locked.

- Inline comments and reviewer assignments.
- Exception-first review queue.
- Reopen locked items only with permission and logged reason.
- Findings generated from validated issues, not raw AI guesses.
- Condition / Criteria / Cause / Effect / Recommendation supported where appropriate.
- Severity remains editable professional judgment.
- Evidence, tax rule and standard references remain attached to finding lineage.

13. FINOVA Advisory Intelligence

Advisory Intelligence answers four questions: What happened? Why might it have happened? So what? What should we investigate or do next?

13.1 Four-Level Advisory Model

Level	Question	Example
Descriptive	What happened?	Revenue -12% YoY; gross margin 38% -> 31%.

Level	Question	Example
Diagnostic	Why might it have happened?	Margin decline is strongly associated with material cost +21% and discount rate expansion.
Predictive	What if it continues?	Current run-rate scenario indicates lower full-year EBITDA, subject to assumptions.
Prescriptive	What next?	Investigate supplier pricing, SKU margin, discount leakage and logistics cost per unit.

13.2 Core Analysis Packs

- Financial statement analysis.
- Revenue bridge and segment/product/customer analysis where data exists.
- Cost and expense analysis.
- Gross margin / contribution margin analysis.
- Working capital: AR, AP, inventory and cash conversion cycle.
- Variance driver analysis.
- Cash flow and liquidity analysis.
- Selected scenario / sensitivity analysis.
- Tax exposure and reconciliation insight.
- Repeat finding and trend analysis.

13.3 Advisory Output

Output	Requirement
Observation	Objective fact from validated data.
Driver	Evidence-backed likely contributor; not automatically labeled causation.
Implication	Financial/business meaning of the observation.
Hypothesis	Clearly marked assumption requiring investigation.
Recommended Investigation	Specific data/process/user action to validate driver.
Recommended Action	Actionable suggestion only when evidence is sufficient; professional review required.
Scenario	Forecast/sensitivity with explicit assumptions and ranges.

14. Advanced Analytics

Advanced Analytics is the system-wide intelligence surface, not a separate chart gallery.

Domain	Examples
Financial Health	Revenue, margin, EBITDA, liquidity, leverage, working capital, cash flow.
Audit Risk	Tie-out failures, unusual journals, material variances, missing evidence, repeat findings.
Tax Exposure	PPN discrepancy, withholding exceptions, fiscal adjustments, unresolved calculations.
Engagement Health	Completion, review points, overdue tasks, approvals, time/budget where captured.
Advisory Signals	Top drivers, scenario warnings, recommended investigations and client discussion points.

Default question for the dashboard: What requires my attention today - and why?

15. Insight Confidence & Evidence Model

15.1 Claim Types

Type	Meaning	UX Treatment
Confirmed Fact	Directly supported by validated data or deterministic calculation.	State as fact; show source.
Likely Driver	Strong association / multi-source support, but not proven causality.	Label 'Likely Driver' + confidence.
Hypothesis	Reasonable explanation requiring more evidence.	Label hypothesis; suggest investigation.
Scenario	Forward-looking model under explicit assumptions.	Show assumptions/range; never present as certainty.
Unsupported	Insufficient evidence or unsupported rule.	Block conclusion; request human review.

15.2 Evidence Requirements

- Source file and page/sheet/cell/region where feasible.
- Structured input values used.
- Calculation or transformation lineage.
- Model/rule/version and timestamp.
- Confidence score where probabilistic AI is involved.
- Human overrides and approvals.

16. Engagement-Centric UX

Primary navigation: Home | Clients | Insights | Tasks.

Inside a client engagement: Overview | Documents | Workpapers | Tax | Analysis | Findings | Report | Activity.

16.1 Engagement Overview

- Top attention items by severity/materiality.
- Financial, audit, tax and advisory highlights.
- Progress through intake, preparation, review and conclusion.
- Pending approvals and unresolved review points.
- Recommended investigations.
- Direct drill-down to source evidence.

17. AI Behavior & Guardrails

- AI never silently invents missing financial/tax values.
- Unsupported tax scenarios must stop or request professional review.
- AI-generated regulatory/standards citations must resolve to verified source records.
- Advisory recommendations distinguish facts, likely drivers and hypotheses.
- Material financial arithmetic uses deterministic code.
- Final reports/findings remain human-approved.
- Prompt/model/version changes affecting material workflows require regression testing.
- User must be able to inspect why FINOVA produced an important output.

18. Data & Technical Architecture

18.1 Core Entities

Firm -> User -> Client -> Engagement -> Document -> Evidence -> Structured Financial Data -> Workpaper -> Tax Calculation -> Standard Reference -> Review Point -> Analysis Insight -> Advisory Recommendation -> Finding -> Approval -> Audit Event.

18.2 Technical Direction

Layer	Recommendation
Frontend	Next.js + TypeScript; responsive web/PWA.
Backend	FastAPI for AI/data workflows; TypeScript services where useful. Avoid premature microservice complexity.
Database	PostgreSQL with firm-level isolation / row-level security.
Files	Indonesia-region object storage where technically/contractually supported.
Search	PostgreSQL FTS + pgvector initially.
Jobs	Queue/background workers for OCR, extraction, analysis and batch validation.
LLM	Provider abstraction for extraction assistance, reasoning support, drafting and explanations.
Rules	Separate deterministic tax and validation service/library.
Analytics	Structured calculation layer + explainable insight generation.
Observability	Error, latency, AI cost, data lineage, model/rule version and audit event tracing.

19. Security & Privacy

- Encryption in transit and at rest.
- Strict tenant isolation and least-privilege RBAC.
- Audit trail for access, edits, approvals, exports and rule/model versions.
- Configurable retention and controlled deletion/export.
- Customer data is not used for shared-model training without explicit contractual consent.
- External AI/OCR provider data flow, retention, region and training policy must be documented.
- Do not publish absolute data-residency claims unless technically proven for every processor in the configured pipeline.

20. Definition of Done

Area	MVP Definition of Done
Documents	Supported upload -> classification/extraction -> confidence/evidence -> correction -> version history.
Workpapers	TB/GL import -> mapping -> auto-population -> tie-out/variance -> reviewable output.
Tax	Supported scenarios calculate deterministically with versioned rules and reproducible results.
Standards	Material supported outputs can resolve to verified standard/rule references.
Review	Comments, assignment, clearance, approvals, lock/reopen and audit trail.
Analytics	Financial/audit/tax/engagement metrics are calculated from validated data.
Advisory	System produces observation -> likely driver/hypothesis -> implication -> recommended investigation with evidence labels.
Reporting	Approved engagement data can generate editable client-ready draft memo/report sections.
Security	Tenant isolation, permissions, encryption and processor data-flow review pass internal verification.

21. Validation & Success Metrics

21.1 Practitioner Validation

- Interview 5-10 accountants and consultants before freezing supported workflows.
- Use anonymized historical engagements, not toy datasets.
- Compare FINOVA outputs to final professional workpapers/tax calculations/reports.
- Have practitioners score usefulness of Advisory Intelligence separately from factual accuracy.

21.2 North Star

Verified Hours Saved per Completed Engagement - while maintaining acceptable material-error and professional-review thresholds.

21.3 Key Metrics

Metric	Purpose
Document classification/extraction accuracy	Trust in intake layer.
Workpaper mapping acceptance rate	Utility of preparation automation.
Tax regression pass rate	Correctness of supported rule engine.
Material error rate	Quality floor for approved outputs.
Review correction rate	Where AI/system still creates rework.
Insight usefulness score	Do consultants consider insights worth discussing with clients?
Recommendation investigation rate	Do users actually follow FINOVA's suggested investigations?
Repeat engagement usage	Strongest early product adoption signal.
Verified hours saved	Economic ROI.
Paid conversion / willingness-to-pay	Commercial validation.

22. Roadmap

Stage	Build / Validate	Exit Gate
0 - Discovery	5-10 practitioner interviews; collect anonymized templates, reports, tax cases and advisory examples.	Supported use cases and standards corpus defined.
1 - Data Foundation	Portal, PBC, document processing, evidence layer.	Reliable supported intake.
2 - Workpaper Core	Mapping, auto-population, tie-out, review states.	Historical engagement reconstructed.
3 - Tax + Standards	Deterministic supported tax rules + verified source references.	Professional validation + regression suite passed.
4 - Analytics	Financial/audit/tax/engagement insights.	Users identify useful attention items faster.
5 - Advisory Intelligence	Driver analysis, implication, investigations, scenarios, recommendations.	Consultants rate outputs useful and defensible.
6 - Commercial Beta	Onboarding, usage controls, pricing experiments.	Repeat real engagement usage + willingness-to-pay.
7 - Expansion	Broader tax, regulatory intelligence, integrations, enterprise.	Only after validated demand.

23. Pricing Hypothesis

- Pricing remains a hypothesis until beta value is measured.
- Test hybrid pricing: base platform fee + included users/engagements + usage for heavy AI/document processing.

- Anchor pricing to verified hours saved, review capacity, reduced rework and consulting value uplift.
- Track per-engagement AI/OCR/storage cost and gross margin.
- Do not lock enterprise price tiers before evidence from real KAP/consulting buyers.

24. Risks & Open Questions

Risk / Question	Response
Advisory AI overclaims causality	Use fact / likely driver / hypothesis / scenario labels; evidence-first UX.
Accounting-standard licensing/access	Confirm lawful source access and distribution before productizing references.
Tax logic becomes outdated	Versioned rules, effective dates, professional owner, regression tests.
Too much MVP scope	Protect core loop; defer broad integrations and generic features.
Practitioners distrust AI	Make every important result inspectable and editable.
Data is insufficient for recommendations	Return requested additional evidence instead of fabricating advice.
Analytics becomes dashboard clutter	Attention-first design; every insight should connect to action.
Firm methodologies differ	Start with configurable templates and supported mapping patterns.
Who owns rule/standard updates?	Assign product/domain owner and approval workflow before beta.

25. Post-MVP Backlog

- Full regulatory intelligence monitor with version/change tracking.
- Contextual Finova Assistant embedded inside engagements.
- Expanded PPh/PPN/transfer pricing and direct filing integrations.
- ERP integrations prioritized by customer demand.
- Industry benchmark database for stronger comparative advisory analysis.
- Advanced forecasting / scenario planning and continuous monitoring.
- Time, billing, WIP and profitability management.
- Template marketplace with governance and quality controls.
- Enterprise SSO, on-premise and multi-office capabilities.
- Southeast Asia standards/tax localization after Indonesia product-market fit.

FINOVA V3.0 product thesis: Automate repetitive accounting work, preserve professional standards, and turn validated financial data into evidence-backed insight and foresight that consultants can actually use with clients.
